PMA KS Vario
Modular PID control system

Overview
The highly modular temperature control system KS VARIO can manage up to 30 control loops and provide additional measurements. By selecting the right I/O-modules the system configuration can be composed to the exact needs of the application. Required interconnections are made automatically. KS VARIO is the perfect choice when precise temperature is essential for the application. Providing connectivity to the most used communication interfaces KS VARIO can easily connect to PLCs and other control equipment. KS vario supports: Modbus-RTU, Modbus-TCP, Profibus DP, Profinet, Devicenet, Ethernet IP and CANopen.

Besides the sophisticated PID control function KS VARIO also offers special features and monitoring functions for a variety of applications.

Key Features
- Independent remote temperature control system with modular I/O and attractive additional features
- Supports the most commonly used communication interfaces
- Up to 60 analog I/Os and 320 digital I/Os
- Supports calibration with measured value correction
- 2 auto-tuning strategies available
- Synchronized heat-up
- Automatic start-up and boost functions
- Configurable response to sensor break error
- Heater current monitoring and loop alarm
- Transmitter supply
- Direct connection of pressure sensors

Description
A KS Vario system is built upon a base control module and a communication bus coupler module as a minimum and can be extended with additional I/O extension modules. With its flexibility KS Vario is suitable for precise cost-effective temperature control tasks in various applications.
KS Vario provides simple on/off control, DPID control, motorised stepping or master/slave control individual for each channel. Due to the modular system concept, any combination of input & output signals can be assembled.

The integrated monitoring of sensors, the entire control loop and heater current helps to easily identify and fix problems.

Automatic inter-connections reduce installation time
The necessary modules of a Vario system are simply plugged together without the need for tools. All peripheral and data signals, as well as the supply voltages are connected automatically. The external 24 VDC system supply must only be connected to the bus coupler at one point.

Thanks to the plug-in spring clamp connectors for the I/O wiring, quick and simple module replacement is ensured. Identifying labels provide convenient I/O marking.

Modular, up to 30 channels
The base module of KS Vario is fitted with the necessary I/O for up to 8 control loops. Simply by plugging additional I/O modules into the system, a finely graduated expansion up to 30 control loops is possible.
The maximum configuration allows up to 60 analog outputs, up to 34 analog inputs and up to 320 digital inputs or outputs to be processed.
Every system is connected to a field bus coupler, which also provides the supply voltage for the entire system.
**Engineering Tool "BlueControl"**
The Configuration of KS Vario is done by means of the powerful and easy-to-use Engineering Tool "BlueControl", which is connected via a separate RS 232 interface on the KS Vario. Furthermore, BlueControl also allows convenient operation and monitoring of the control system, plus simulation functions for control mode and control loop.

**Fast software update via BlueFlasher**
Via the local RS 232 interface of the KS Vario, loading a software update into the controller's Flash EPROM is a simple matter.

**Simple system configuration**
Apart from a field bus coupler and the base controller, there is choice of some 20 different I/O modules for making up a KS Vario multi-controller system. BlueControl provides a very convenient way to configure and set-up a system.

The following I/O modularities are available:
- Digital I/O: 2, 4, 8 and 16 channels
- Analog I/O: 2, 4, and 8 channels

The KS vario automatically tests whether the system configuration assigned via BlueControl or field bus confirms with the modules actually connected.

**See below for a list of available modules.**

**Flexible scan rates from 100 ms**
The KS Vario system offers individual selection of scan rate. This allows high flexibility when adapting to the connected control loops. For example, the combination of fast mold heating with slow barrel heating presents no problems. The minimum adjustable scan rate is 100 ms.

**Input circuit monitoring and output 'hold' on sensor break**
In case of a fault in a measurement circuit, the built-in monitoring function ensures increased operational safety for the plant. The inputs are monitored for break, short circuit, and wrong polarity of sensor and leads. If the monitor is triggered, the controller's output action can be defined as follows:
- Predefined output value
- Outputs disabled
- "Hold" of mean output value

In order to continue with production in case of a sensor break, it is necessary to maintain the temperature at the last mean value of the output signal. The KS Vario signals a sensor break via the field bus or an alarm output, so that the sensor can be replaced. As soon as the KS Vario detects a valid input value after replacement, controller operation is continued automatically.

**Control loop monitoring (loop alarm)**
The control loop monitoring function checks the functionality of the entire control loop. It detects if there is no change of the process value after a corresponding change of the output signal.

**Measurement value correction**
The correcting function is used to change or scale the measurement value. Especially convenient is the option for implementing the changes online via a screen display of the "BlueControl" Engineering Tool.

**Alarm and safety functions, alarm outputs**
The KS Vario offers comprehensive alarm processing functions. Arbitrary alarm signals can be assigned to max. 8 digital outputs. If several alarm signals are assigned to one output, the internal connections are made automatically.

The following alarm signals are available per channel:
- Relative measured value alarm for monitoring the control deviation (process value – setpoint)
- Absolute measured value alarm for monitoring limit values, independent of setpoint value.
- Relative measured value alarm with alarm suppression, i.e. the alarm is not triggered during start-up or setpoint changes.
- Loop alarm (control loop monitoring)
- Sensor fault alarm
- Heating current alarm

**Heating current monitoring and alarm**
One current transformer per max. 8 heating zones can be connected to the Vario system. Rectification of the transformer signal is done by the KS Vario controller or by the Vario I/O modules with heating current input.

Apart from measuring all the heating currents, every value is monitored for a minimum limit and for short circuit of the solid-state relay. If a limit is exceeded, this information is used to trigger a digital output or it is transferred to the field bus with an indication of the respective channel number.

**Automatic heating current limit setting via trigger signal**
The heater current limit values of all monitored zones can be set automatically by means of a "heating current trigger signal" (also directly via the BlueControl tool operating page). In this case, the heating current limit values are formed from the actual measured values minus a heating current tolerance: HC.tol. This parameter indicates the max. permissible deviation from the "normal" heating current process value in percent (0...50).

**Variations of the mains voltage are compensated during heating current measurement**
To prevent variations in the mains voltage from affecting heater current limit detection, the KS Vario system is able to measure mains voltage (1 phase or all 3 phases separately).

The measured mains supply values are compensated according to the adjustable reference value in the controller.

**Controller & positioner operation**
The KS Vario is configurable as a signaler, two or three-point controller, three-point controller with evaporative water cooling, master/slave operation, or for three-point stepping control. Similarly, it can be configured for continuous or split-range control. Furthermore, bumpless auto/manual switchover is provided. During manual operation, the positioning output can be set to any value or relative duty cycle.

**Melt pressure measurement for extrusion plants**
The KS Vario system has inputs for the direct connection of melt pressure sensors.
**Second setpoint and ramp function**
Via any of the digital inputs or the field bus, a second setpoint can be activated (e.g. for setpoint lowering).

By means of the setpoint gradient (ramp) function, which starts automatically during system start-up and after every change of the setpoint value, the function ramps up or down to the new setpoint value.

**Synchronized heat-up**
This ‘automatic’ temperature ramping function prevents thermal stresses within a group of heating zones. The KS Vario automatically detects the zone with the slowest heating gradient, and controls the gradient of all the other zones accordingly, until the set points are reached. This happens independently of actual process values, i.e. zones that might already be warm are not heated until the other zones have reached the same value, after which they are heated together up to their respective setpoints.

**Start-up circuit**
High-performance heating elements with magnesium oxide insulation must be heated slowly, to remove any humidity and to prevent destruction. With activated start-up circuit, the controller uses the adjusted start-up power limit (e.g. 40%) until reaching the start-up setpoint (e.g. 95°C). For protection of the heating elements, the duty cycle is reduced to ¼ during start-up. The start-up setpoint (e.g. 95°C) is maintained during the selected start-up holding time. That followed, the controller uses the main setpoint W.

**Boost function**
The boost function briefly switches all the control loops to a higher setpoint, e.g. to remove scale from the nozzles during mold heat-up.

**Self-tuning**
This function is fitted as standard for automatic determination of the best control parameters. Self-tuning is started on demand via the field bus or the Engineering Tool, and uses the delay time Tu and the max. rate of change Vmax of the temperature control loop to calculate the optimum settings for fast line-out without overshoot.

With three-point controller configuration, the "cooling" parameters are determined separately. Self-tuning also works with an activated start-up function. For applications with adjacent heating zones and strong thermal coupling, synchronous self-tuning can be started for the loops involved (max. 30). Synchronous self-tuning can be activated or disabled individually for every control loop. Up to 4 individual groups can be synchronized with this procedure.

**Self-tuning at setpoint**
This newly developed feature determines the optimum control parameters also at setpoint, either on request or automatically (following a detected tendency to hunt). The procedure works without oscillation, and with only a minimum variation of the controlled variable.

**Control functions via digital inputs**
Up to 8 digital inputs can be assigned for the following remote control functions for any of the control channels:
- Switch-over to a different set of parameters
- Disabling of all controllers
- Switch-over to 2nd setpoint
- Boost function for hot runners
- Auto/manual switch-over
- Data read-out via field bus

**Signal assignment to digital outputs**
Max. 60 digital outputs can be assigned to the following signals:
- Heating or cooling signal
- Any common alarm
- Remote control via field bus

**Signal assignment to analog outputs**
Max. 60 analog outputs can be assigned to the following signals:
- Control signal (heating and cooling)
- Control signal (only heating)
- Control signal (only cooling)
- Process value (transmitter function)
- Setpoint
- Remote control via field bus

**Forcing**
All unused digital and analog outputs can be 'forced' via the field bus. Similarly, all inputs can be read via the field bus.

**Watchdog**
The KS Vario is fitted with a hardware watchdog, that is triggered internally every 0,26 seconds.

**TECHNICAL DATA**
Base control module and channel extension modules

For other expansion modules, please refer to the relevant data sheets. A survey of the modules is given below.

**VERSIONS OF THE CONTROL MODULE KS VARIO T4/UTH**
- 4 Thermocouple inputs
- 1 heating current input
- 8 digital outputs
- max. 4 control loops

**KS VARIO T8/UTH**
- 8 Thermocouple inputs
- 1 heating current input
- 8 digital outputs
- max. 30 control loops

**KS VARIO T4/RTD**
- 4 Resistance inputs
- 1 heating current input
- 6 digital outputs
- max. 4 control loops

**KS VARIO T6/RTD**
- 6 Resistance inputs
- 1 heating current input
- 6 digital outputs
- max. 30 control loops

**INPUTS**
UTH Version

**Thermocouples**
Types L, J, K, N, S, and R to DIN IEC584

Value display: in °C or °F
Resolution of A/D converter: ≥14 bits
Input resistance: ≥1 MΩ
TC break monitoring
Monitoring current: ≤ 1 µA
Configurable controller reaction on error
Polarity monitoring:
Responds when input signal is 30 K below range
Temperature compensation:
Internal or external Sensor
Additional error: ≤ 1 K/10 K change of terminal temperature

Permissible voltages between inputs: 1 VDC and 2 VAC
Permissible voltage between inputs and ground: 5 VAC

**Direct voltage**
Range: 0...70 mV linear
Input resistance: ≤ 1 MΩ
Error: ≤ 0.1 %
Input span scalable via measurement correction

**RTD Version**
**Resistance thermometer**
Pt 100 to DIN IEC 751
Range: -200...850 °C
With linearisation (temperature-linear)
Error: ≤ 1 K ± 1 digit Resolution of A/D converter: >14 bits

Connection in three-wire technique without lead adjustment.
With two-wire connection, a calibrating resistor equal to the lead resistance must be fitted.
Lead resistance: ≤ 30 Ω
Sensor current: ≤ 0.3 mA
Input circuit monitoring for break in sensor or lead, or short circuit.
Configurable controller reaction on error

**Resistive input, linear**
Range: 0...450 Ω, without linearisation
Connection in three-wire technique without lead adjustment.
With two-wire connection, a calibrating resistor must be fitted.
Sensor current: ≤ 0.3 mA
Input circuit monitoring for break in sensor or lead.

**Scan rate**
100ms, 200ms, 400ms, ...
Selectable per channel

**Heater current input, heater current monitoring**
Current summing principle (1 current transformer for max. 8 heaters).
Connection of conventional current transformers.
Input span: 0...50 mA AC
Input resistance: approx. 170 Ω

e.g. PMA standard current transformer 0...50A / 0...50 mA AC

**Solid State Relay short circuit detection**
Threshold value of the short-circuit monitor: 1.5 % of selected span (e.g. 0.45 A with a span of 30,0 A)
Optional compensation of mains voltage variations for heater current monitoring.
Separate for every phase
The mains voltage is measured via a converter module (accessory) and must be connected to an analog input module (e.g. VARIO AI 2/SF)

**OUTPUTS**
**Logic outputs**
Depending on version (RTD or UTH), 6 or 8 outputs are available for connecting solid-state relays or as alarm outputs.
Outputs are short-circuit-proof, and switch 24 VDC (grounded load).
Nominal range of switched output voltage: 18...30 VDC to DIN 19 240.
Nominal output current: 70 mA
Voltage drop across output at full load: 0.6 V typical, 1 V max.

**POWER SUPPLY (provided by bus module)**
Analog supply: 24 V ≤ 30 mA
Logic supply: 7,5 V ≤ 150 mA via potential routing
Segment supply: 24 V DC ≤ 500mA via potential routing

Protection class III (protective low voltage).

**CONTROL FUNCTIONS**
Configurable as:
• Signaller with 1 or 2 outputs
• Two-point DPID controller
• Three-point DPID/DPID controller
• Three-point DPID/DPID controller with output algorithm for evaporative water cooling (extruders)
• Split-range controller
• Continuous controller
• Positioner function with manual operation of three-point controller
• Three-point stepping controller
• Master/slave controller
Supporting functions
• Self-tuning function
• Start-up function
• Synchronized heat-up
• Boost function

**ALARM FUNCTIONS**
Output: logic signal or via interface
The following alarms are configurable for every control loop:
• relative or absolute measured value alarm
• relative measured value alarm with alarm suppression
• Sensor break alarm
• Heating current alarm
• Control loop alarm

**STATUS DISPLAYS**
• Display LEDs for:
  • Bus diagnostics
  • Run
  • Self-tuning
  • Alarm
  • Error message

**PROGRAM MEMORY**
Flash EPROM
Firmware update via BlueFlasher utility

**ENVIRONMENTAL CONDITIONS**
**Permissible Temperatures**
Ambient temperature (operation): 0...55 °C Ambient Temperature (storage/transport): -25...85 °C
Humidity (operation): 75 % on average; 85 % occasionally; no condensation
Humidity (storage/transport) 75%, on average; 85%, occasionally. No condensation

**ENVIRONMENTAL CONDITIONS**
**Permissible Temperatures**
Ambient temperature (operation): 0...55 °C Ambient Temperature (storage/transport): -25...85 °C
Humidity (operation): 75 % on average; 85 % occasionally; no condensation
Humidity (storage/transport) 75%, on average; 85%, occasionally. No condensation
INFLUENCING FACTORS

Power supply effect
None. In case of mains failure, the configuration data are stored in a non-volatile EEPROM.

Vibration test
Sinusoidal vibrations according to IEC 60068-2-6; EN 60068-2-6
5g load, 2 hours for each space direction

Shock test
According to IEC 60068-2-27; EN 60068-2-27
25g load for 11 ms, half sinusoidal wave, three shocks in each space direction and orientation

ELECTROMAGNETIC COMPATIBILITY

Noise Immunity Test according to EN 50082-2
Electrostatic discharge (ESD) according EN 61000-4-2 / IEC 61000-4-2
- Criterion B
- 6 kV contact discharge
- 8 kV air discharge

Electromagnetic fields according EN 61000-4-3, IEC 61000-4-3
- Criterion B
Influencing factor max. 1% of the range in the frequency-range of 400-1000MHz (only RTD versions)
- Field strength: 10 V/m

Fast transients (burst) according EN 61000-4-4 / IEC 61000-4-4
- Criterion B
- Remote bus: 2 kV
- Voltage supply 2 kV
- I/O cables: 2 kV
- Criterion A
- All interfaces: 1 kV

Surge voltage according EN 61000-4-5/ IEC 61000-4-5
- Criterion B
- AC supply lines: 2.0 kV/4.0 kV (symmetrical/asymmetrical)
- DC supply lines: 0.5 kV/0.5 kV (symmetrical/asymmetrical)
- Signal lines: 1.0 kV/2.0 kV (symmetrical/asymmetrical)

Conducted interference according EN 61000-4-6, IEC 61000-4-6
- Criterion A
- Test voltage 10 V

Noise Emission Test According to EN 50081-2
Noise emission of housing: EN 55011 Class A

GENERAL

Housing
Dimensions (W x L x H): 48.8 x 71.5 x 120 mm
Drawing: KS vario T8/UTH

Protection mode
IP 20

Protection class
Class 3 to IEC 60 536 (VDE 0106)

CE marking
Fulfils the European Directives for electromagnetic compatibility and low voltage.

Certificates
UL listing, CSA certification

Electrical connections
Screwless spring-clamp connector strips

SETUP UTILITY

BlueControl (Engineering Tool)
PC-based program for configuration, parameter setting, and operation (commissioning) of the KS Vario system. All settings are stored, and can be printed on request. Moreover, a powerful data acquisition module with trend graphics is available.

Simulation
The built-in simulation serves to test the controller settings, but can also be used for general training and observing the interaction between controller and process.

Online measurement value correction Calibration of the entire input circuit is possible with just a few mouse clicks.

System configurator
Selection of KS Vario bus coupler and I/O modules.

Hardware requirements
A configurator cable is required for connecting to the KS Vario system (Accessories).

ORDERING DATA FOR ACCESSORIES

General VARIO-accessories
End clamp (1 per unit)  KSVC-109-00011
CAN/DeviceNet connector with 2 cable entries, D-Sub, screw terminal connection KSVC-109-00191
Universal ground terminal block (1 per unit)  KSVC-109-00021
Coding profile (100 per unit)  KSVC-109-00031
Zack markers for labeling modules (10 per unit)  KSVC-109-00041
Screw driver according DIN 5264 (for spring-clamp terminals)  KSVC-109-00051
Labeling field, snap in, breadth: 2 (10 per unit)  KSVC-109-00061
Labeling field, snap in, breadth: 8 (10 per unit)  KSVC-109-00071
Labeling sheets for labeling field, breadth: 2 (72 per unit)  KSVC-109-00081
Labeling sheets for labeling field, breadth: 8 (5 x 15 per unit)  KSVC-109-00091
Spring-clamp terminals, grey (10 per unit)  KSVC-109-00101
Spring-clamp terminals, grey, with shield connection (5 per unit)  KSVC-109-00111

Tools
BlueControl Basic (Engineering-Tool)  KSVC-109-10001
BlueControl Expert (Engineering-Tool)  KSVC-109-10011
RS232-interface cable for BlueControl  KSVC-109-00101

Current transformer
Current transformer, 50 A  KSVC-109-10001
3-phase current transformer, 3 x 15/30 A  KSVC-109-10011
Current transformer with adjustable transmission ratio 25..150A  KSVC-109-00101
3-Phase current transformer with adjustable transmission ratio 25..150A  KSVC-109-30001
Line-voltage transmitter

Solid state relays
We offer a wide range of Solid State Relays.
Our sales team is happy to help you find the right product for your specific needs
